

Elicitation Meeting: JAD with Teck4

Date: January 19th, 2017

Wholesome: Technical questions needs to be answer

Wholesome: Mobile app was mentioned once, wondering what that was supposed to be meant for?

Answer: Just needs to be mobile, someone needs to be available anytime, anywhere.

Wholesome: Design question, does it need to be integrated with Facebook, Google Calendar?

Answer: Idea is to bring together, so bring all apps together.

Wholesome: Technical question: Existing system uses Drupal, does that matter for us developers?

Ans: Doesn't have to be integrated with UVic database. Not particularly, database could be our choice. So no constraints.

Wholesome: What info does the new system have to share with existing system? Permission of students/UVic accounts to view events? UVic mail would be sufficient for verification?

ANSWER: No restrictions for reading the events, so anyone could see all the events. Only permission when registering the event. Poster of the event could categorize the events to a specific group of people. Not the other way around.

Wholesome: Events across universities?

Answer: Maybe another year.

Wholesome: How would you notify your users for the events?

Answer: Calendar integration/email/SMS would be enough.

Wholesome: User accounts for specific groups like UVSS/ESS that could post events. How would you verify them?

Answer: Need specific people to have a meetings with staff to set up this special account.

Wholesome: Text message might be a safety hazard, how much do you want to know about your users?

Answer: Don't need to worry about the security, just don't keep all the data, just keep meta data.

Wholesome: Any integrated with course time availability that has conflict with event?

Answer: Not necessarily, just a basic search for specific time, say 2-5, and find the search results.

Wholesome: User profiles question

Answer: Anonymous user account could have the basic ability to view pages, and search. Users don't have to register to view events.

Need to allow off campus student to see on campus events, say Camosun student could view the UVic events too.

Need admin to control inappropriate events.

User could flag/report events. Anonymous user could flag events.

Disable the ability for the user to post dangerous events.

Need to filter adult events, user that register for under age.

Wholesome: Performance question

Answer: No specific requirements for uptime of the server, has to perceive to be a fast site and that is enough.

Wholesome: Alternative view/UI for the events?

Answer: Want info/event to be perceived as a calendar view. So default calendar view but could have alternative say list view.

Wholesome: Do you want to have support/donations/featured for past events?

Answer: Short answer is No.

I don't like the idea of it.

It could be both ways?

Wholesome: Who are your administrators?

Answer: Just the people from UVSS, somebody that is in UVic. The same group of people that monitor the events posters on the wall right now.

Host page that has the history that the users has remember filtered before, from this page the user/verify user could filter out the events they want to pay attention to.

Wholesome: What is the capacity of our user database?

Answer: Only a small amount of people create profiles, so starting out could be small amount say 2000 users, but needs to be scalable if needed.

Wholesome: Personal events?

Answer: No, may be too messy.

Wholesome: Anything you want to add on?

Answer: Basically, a calendar with list view option, and search with filler like category, time, duration.

Wholesome: Do you require for the user to put in specific information for posting events?

Answer: Need to have a time/place/name, Age restriction, and description of the event.
Optional: Faculty restriction, images. Could have default options if chosen.
5 pictures max, in the calendar view just show the main picture

Wholesome: How are we going to be creating tags/ categories?

Answer: Like an instagram hashtag, user could dynamically generate. Since sources are consistent, don't worry about?

Or a mix of both. So some general tags, and with some dynamically generated.

Filter by category and search by tag.

Wholesome: Contact info?

Answer: Our group email is on the RFP, so just use that to contract us, our corporate website should be up tonight.
